

**IMPROVING THE EDUCATIONAL EXPERIENCES OF
ABORIGINAL CHILDREN AND YOUNG PEOPLE**

KALGOORLIE ICC REGION

**SUMMARY OF FINDINGS FROM VOLUME THREE OF
THE WESTERN AUSTRALIAN ABORIGINAL CHILD HEALTH SURVEY**

This booklet summarises information from the third volume of the Western Australian Aboriginal Child Health Survey: *Improving the Educational Experiences of Aboriginal Children and Young People*. The purpose of this profile is to provide information specific to the Indigenous Coordination Centre (ICC) region of Kalgoorlie. ICCs have recently replaced ATSIC Regional Councils now that ATSIC no longer exists. However, for statistical continuity, information in this profile is based on ATSIC geographical boundaries.

To protect the confidentiality of individuals and families, the information provided in this profile can only be given at the ICC region level. Unless otherwise stated, data in this publication refer to Aboriginal or Torres Strait Islander students in the Kalgoorlie ICC region.

About the survey

THE Telethon Institute for Child Health Research (the Institute) conducted the survey in conjunction with the Kulunga Research Network to obtain information about Aboriginal and Torres Strait Islander children aged from 0–17 years. The aim of the survey was to provide evidence to develop strategies that promote and maintain healthy development and the social, emotional, academic and vocational wellbeing of Aboriginal and Torres Strait Islander children. The survey was divided into three parts:

- ❖ household survey that visited 2,000 households and obtained information on 5,300 Aboriginal and Torres Strait Islander children aged 0–17 years, their carers and other relatives living in the homes
- ❖ youth self report survey for young people aged 12–17 years
- ❖ schools survey where information about students was obtained from school teachers and principals.

Consultation

ALL phases of the survey, including its development, design and implementation, were under the direction of the Western Australian Aboriginal Child Health Survey Steering Committee. The Steering Committee comprises senior Aboriginal officers from a cross-section of agencies and settings, and has the ongoing responsibility to control and maintain: the cultural integrity of the survey methods and processes, employment opportunities for Aboriginal people, data access issues and communication of the findings to the Aboriginal and general community and appropriate and respectful relations within the study team, with participants and communities, with stake holders and funding agencies and with the governments of the day.

“The information provided by Aboriginal students, principals, teachers and parents is rich in detail and provides a wonderful opportunity for change through developing strategies for engaging in a whole of government approach to the early years of life and learning. The findings of this report provide an opportunity to re-engineer existing programmes, strategies and student support services, realign resources and redefine the role of Aboriginal and Islander Education Officers to focus on the foundation of early childhood education and re-engaging Aboriginal parents as educators of their children and young people.”

(Professor Ken Wyatt AM, member Aboriginal Steering Committee)

Measuring academic performance

THREE measures were used by WAACHS to measure how well Aboriginal students were doing at school. Firstly, teachers rated students against other students in three areas of performance: literacy, numeracy and overall academic performance. Secondly, two standardised tests were given: a test of non-verbal performance (the 'Matrices' test) and a test of English language reasoning (the 'Word Definitions' test). Thirdly, with permission from parents and carers, test scores from the West Australian Literacy and Numeracy Assessment (WALNA) were obtained from the Western Australian Department of Education and Training — these data provided an independent measure of performance.

The main measure of overall academic performance used by WAACHS was the teacher ratings. To check whether the teacher ratings were accurate they were compared with scores from non-verbal and English language tests. The results from these comparisons showed that teacher ratings were a reliable measure of academic performance.

Teacher ratings of academic performance

Teachers were asked to rate each Aboriginal student in the survey in comparison with other students of the same age. This was done for the key learning areas of literacy and numeracy along with their overall academic performance. Each student's performance in each of these areas was rated on the following five-point scale:

- ❖ Far below age level
- ❖ Somewhat below age level
- ❖ At age level
- ❖ Somewhat above age level
- ❖ Far above age level

Students rated as either 'far below age level' or 'somewhat below age level' are referred to as having *low academic performance*.

Accuracy of the estimates

ALL figures in this booklet are careful estimates because not every family in the region was included in the survey. As such these figures may be different from those that would have been obtained if everyone had been included in the survey. The data have been calculated at a 95% level of confidence. This means that there is a 95% chance that the full population figures would be within the range shown by the confidence interval. In a graph the extent of confidence in an estimate is presented by means of vertical confidence interval bars ($\bar{\square}$). The bars show that there is a 95% chance for the true value for a data item to lie somewhere between the upper and lower limits of the bar. Sometimes, where the populations might be very small, it may not be possible for accurate estimates to be made. In these cases, the graph will have very large confidence interval bars. The smaller the confidence interval bar the better the estimate.

When comparing two data items in a graph it may appear that there is a large difference between the two, but if the confidence interval bars for these items overlap it is possible they are the same. We can only be sure of a difference if there is no overlap of confidence interval bars. For example in the lower graph on page 3 there appears to be a large gap between Years 11 and 12 but because the confidence interval bars overlap it is possible that the true value could be the same for both. On the other hand, the bars on Years 10 and 11 do not overlap so we can be confident that they are indeed different.

AT the time of the survey 19,600 Aboriginal students aged 4–17 years were attending 750 schools in WA —1,000 of these students and 20 schools were in the Kalgoorlie region. Almost all Aboriginal students (97%) in the Kalgoorlie region were attending Government schools. Across WA 85% of students attended Government schools, 12% attended Catholic schools and 2% attended independent schools.

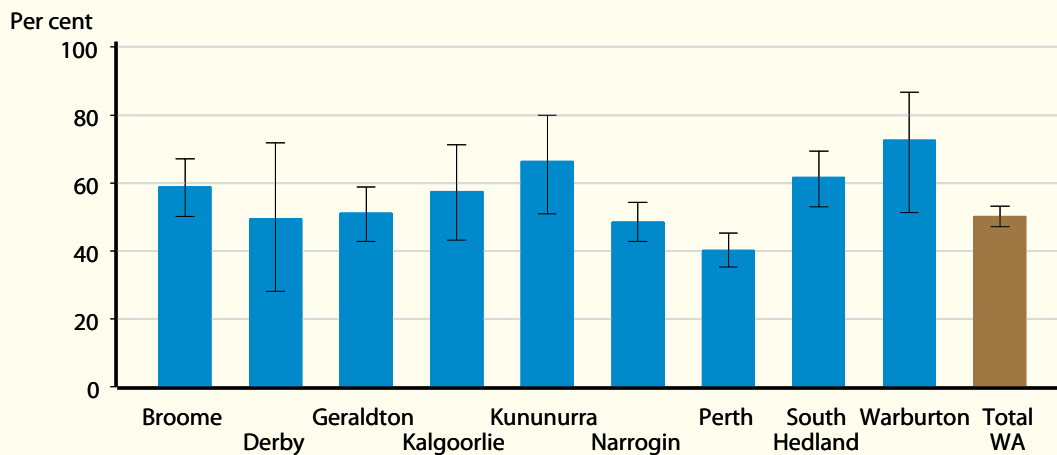

School attendance

ONE way to compare school attendance of Aboriginal students and non-Aboriginal students is to compare the median number of days absent (i.e. the number of days of school missed by half the students). In WA half the Aboriginal students missed 26 days or more of school per year compared with 8 days or more by half of the non-Aboriginal students. Only 18% of Aboriginal students had less than 8 days absence from school. In this profile, missing 26 days or more of school in a year has been referred to as poor school attendance.

School attendance and ICC region

In the Kalgoorlie region, six in ten (58%) students had poor school attendance. As shown in the graph, this was similar to many other regions in WA with the largest difference occurring between the Kalgoorlie region and the Perth region where 40% of students had poor attendance.

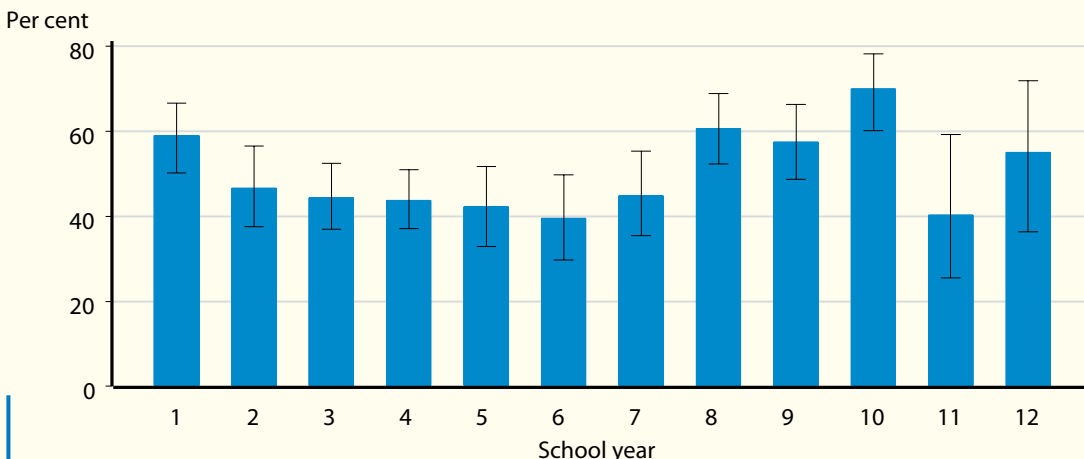

Aboriginal students with poor school attendance, by ICC region

School attendance and school year

Poor school attendance in WA was highest among Year 10 students (70%). This was much higher than primary school students from Year 2 to Year 7 and students in Year 11.

Aboriginal students with poor attendance, by year at school

Factors common to students with poor school attendance

THE survey found 14 factors associated with missing school. These factors didn't cause children to miss school but children who missed lots of school had these factors in common with each other. For example, many children who missed school were assessed as being at high risk of clinically significant emotional or behavioural difficulties, had trouble getting to sleep or lived in families that had a high level of stress in their lives. Not every Aboriginal child had these issues but the children who missed 26 days or more were more likely to.

Socio economic disadvantage

Poor school attendance was more likely among students at government schools in areas of least socioeconomic disadvantage than among students in government schools in the most disadvantaged areas.

Age of student

Students aged 4 to 7 years were more likely to miss 26 days or more of school than students aged 8 to 11 years.

Day Care

Students (4 to 11 year-old students only) who had never been in day care were more likely to have poor school attendance than students who had been in day care.

Trouble sleeping

Students who had trouble getting enough sleep were more likely to have poor school attendance.

Language spoken in playground

Poor school attendance was more likely where Aboriginal English or an Aboriginal language was spoken by students in the school playground than if English was spoken in the playground.

Risk of clinically significant emotional or behavioural difficulties

Students assessed from teacher responses to a Strengths and Difficulties Questionnaire as being at moderate or high risk of clinically significant emotional or behavioural difficulties were more likely to have poor school attendance than students at low risk.

Carer need to see school principal

Where the student's carer had needed to see the principal because of problems the student was having at school students were more likely to have poor school attendance.

Primary carer education

Missing 26 days or more of school was more likely if the primary carers had not been educated beyond Year 9.

Primary carer labour force status

Poor school attendance was more likely if the student's primary carer was not in the labour force (i.e. was not employed and not looking for work) than if they were employed.

Looks at book with student

Students who did not have someone from their household to look at a book with them every day were more likely to have poor school attendance.

Life stress events

Students who lived with families that had experienced 7–14 life stress events in one year were more likely to have poor school attendance than students in families with less than 3 life stress events.

Housing tenure

Students are more likely to have poor school attendance if they are living in rented accommodation than in homes that were owned or being bought.

Aboriginal and Islander Education Officer (AIEO) at the school

AIEOs were in attendance at 38% of schools in WA, at 79% of schools in areas of high or extreme isolation and at 77% of schools where at least 10% of the students were Aboriginal. Students at these schools are more likely to have poor school attendance.

Academic performance

DIFFERENCES in education measures between Aboriginal and non-Aboriginal students are in the order of 30 to 40 percentage points, much larger than any differences observed in physical and mental health measures. Differences in the academic performance of Aboriginal and non-Aboriginal students are evident from the earliest years of school and affect Aboriginal students regardless of where they live.

Aboriginal and non-Aboriginal children — differences in health, mental health and education

Participation and retention

Aboriginal children are less likely to be in the school system, beyond the compulsory school age. Only one in four Aboriginal students who start Year 8 make it to Year 12, compared to three in four non-Aboriginal students. In the Kalgoorlie region, 64% of Aboriginal 15–17 year-olds were no longer at school compared with 47% in WA.

Overall academic performance

At the time of the survey, six in ten (60%) of the Aboriginal students in the Kalgoorlie region were rated by their teachers as being at low academic performance similar to total WA (58%). For WA non-Aboriginal population the proportion was much lower (19%). As shown in the graph below, with the exception of Kununurra and Warburton, there were no statistically significant differences between the proportion of students at low academic performance in the Kalgoorlie region and other regions of the state.

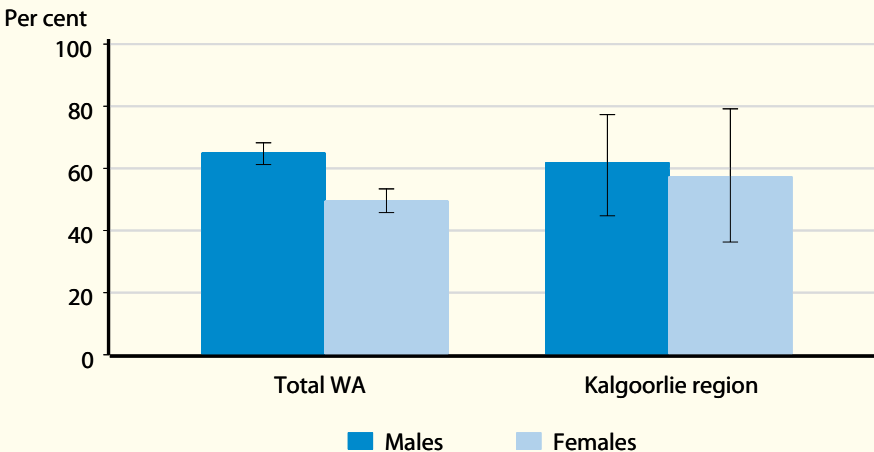

Aboriginal students at low academic performance, by ICC region

Overall academic performance by sex

In WA, almost two-thirds of males (65%) were at low academic performance compared with half of females (50%). It was similar in the Kalgoorlie region where 62% of males and 57% of females were at low academic performance. In the non-Aboriginal population there was little difference in the academic performance of males and females.

Aboriginal students at low academic performance, by sex

Overall academic performance by year at school

For all Aboriginal students, the proportion at low academic performance varied by year at school. Students in years Kindergarten to Year 7 (Years K–7) were more likely than students in Years 11 to 12 to be performing below age level at school (60% compared with 39%). For students in Years 8 to 10, 54% had low academic performance. In the Kalgoorlie region 65% of students in Years K to 7, 44.3% of students in Years 8 to 10 and 55.3% of students in Years 11 or 12 had low academic performance.

Aboriginal students aged 4–17 years — Proportion at low academic performance, by school year

Factors influencing academic performance

A NUMBER of student, carer, family and school related factors were examined for their contribution to poor academic performance. It is worth noting that among the range of health factors examined, very few were found to be independently associated with academic performance.

THE three main indicators of poor academic performance among Aboriginal students:

- ❖ school attendance
- ❖ primary carers level of education
- ❖ risk of clinically significant emotional or behavioural difficulties.

School attendance

While almost all Aboriginal children attend school, how well they did at school was influenced by how often they attended. The graph below shows that, for both Aboriginal and non-Aboriginal students, as the number of days away from school increased the proportion of students who did well at school decreased. For example, it shows that for Aboriginal children who missed no school, 60% had high academic performance while those who missed over 100 days of school, only 20% had high academic performance. For non-Aboriginal students in the 1993 WA Child Health Survey who missed no school, about 85% had high academic performance. This fell to 70% where 50 school days were missed.

An obvious difference between Aboriginal students and non-Aboriginal students is the maximum number of days absent over a given year (over 140 days compared with about 50 days). However, regardless of the number of days absent the proportion with high academic performance was always higher for non-Aboriginal students than Aboriginal students. This suggests that attendance is not the only cause of poor school performance.

Aboriginal and non-Aboriginal students at high academic performance, by days absent from school

Primary carer level of education

Throughout WA, the proportion of students with average or above average academic performance increased with increased levels of education of the primary carer. Where carers had not attended school, only 25% of students had average or above average academic performance. In contrast, where carers had 13 years or more education, the proportion of students with average or above average performance was 62%.

Aboriginal students at average or above average academic performance, by educational attainment of primary carer

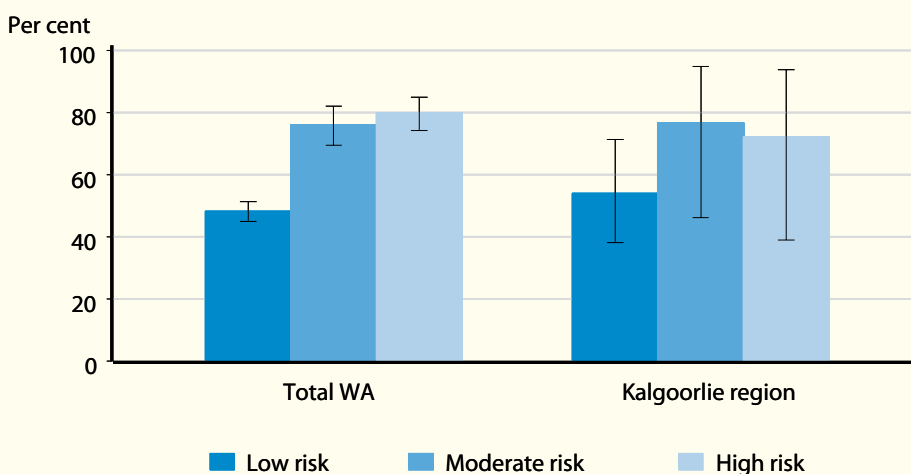

Risk of clinically significant emotional or behavioural difficulties

Teachers were asked to complete a Strengths and Difficulties Questionnaire (SDQ) to see whether the student was at low risk, moderate risk or high risk of clinically significant emotional or behavioural difficulties. WA students at moderate and high risk were more likely to have low academic performance. Eight in ten (80%) students who were at high risk of clinically significant emotional or behavioural difficulties and 76% of students at moderate risk had low academic performance compared with less than half (48%) of the students at low risk of such difficulties.

In the Kalgoorlie region, 120 students were at high risk of clinically significant emotional or behavioural difficulties and 150 students were at moderate risk. Of these students, about three quarters (72% and 77% respectively) were at low academic performance. Of the 720 students who were at low risk of clinically significant emotional or behavioural difficulties, 390 (54%) were at low academic performance. However, as shown in the graph below, no significant differences were found in the Kalgoorlie region in academic performance regardless of level of risk of clinically significant emotional or behavioural difficulties.

Aboriginal students aged 4-17 years — Proportion at low academic performance, by risk of clinically significant emotional or behavioural difficulties

Other factors influencing academic performance

While carer education, student risk of clinically significant emotional or behavioural difficulties and school attendance were the three main indicators of academic performance a number of other factors were also found to have some influence.

Aboriginal English as the main language spoken in the classroom

Students who spoke Aboriginal English in the classroom were at a disadvantage in terms of academic performance. They were more likely to be rated at low academic performance than students who spoke Standard Australian English.

At the time of the survey, 19% of students in the Kalgoorlie region spoke Aboriginal English in the classroom compared with 15% in WA. Of the 190 students in the Kalgoorlie region who spoke Aboriginal English, 150 (81%) were rated by their teacher at low academic performance. In WA there was a clear difference in the proportion of students with low academic performance between those who spoke English and those who spoke Aboriginal English or other languages (53% compared with 80% and 77%). In the Kalgoorlie region the differences were not statistically significant.

Aboriginal students at low academic performance, by language spoken in the classroom

Primary carer having seen the class teacher in the last six months about a school problem

Students whose carers had needed to see the class teacher in the last six months about a problem the student was having at school were more likely to be rated at low academic performance than those students whose carers had not needed to see the class teacher about a problem.

Trouble saying certain sounds

Students who had trouble saying certain sounds were more likely to be rated at low academic performance than those without this type of speech difficulty. In WA, 12% of students had trouble saying certain sounds. In the Kalgoorlie region, 150 (15%) students had trouble saying certain sounds and 110 (70%) of these were rated as having low academic performance.

Labour force status of primary carer

The students of primary carers who were not in the labour force (not working or not looking for work) were more likely to have low academic performance than students whose primary carer was employed. In WA, 47% of Aboriginal students had a primary carer who was not in the labour force. This was slightly lower than in the Kalgoorlie region where the primary carers of 55% of students were not in the labour force.

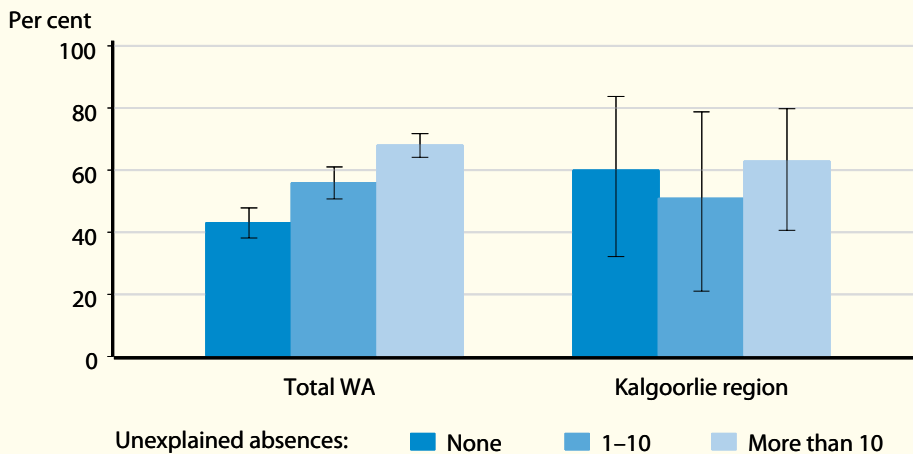

Attendance at Aboriginal funerals

Students whose primary carer had attended an Aboriginal funeral in the last 12 months were more likely to be rated at low academic performance than students whose primary carer had not attended an Aboriginal funeral. Almost three quarters (72%) of students in the Kalgoorlie region had a primary carer who had attended a funeral, slightly higher than the proportion for the whole state (70%).

Unexplained absence from school

Students who had more than 10 days of unexplained absence (i.e. where the school had no satisfactory explanation for the absence) were more likely to have low academic performance than students who had no unexplained absences. About 510 (51%) students in the Kalgoorlie region had more than 10 days of unexplained absence and of these 320 (63%) had low academic performance. This was similar to WA, where 48% of Aboriginal students had more than 10 days of unexplained absence of whom 68% had low academic performance. As shown in the graph below, for WA there is a relationship between low academic performance and the number of days of unexplained absence. In the Kalgoorlie region no such relationship can be seen.

Aboriginal students at low academic performance, by number of unexplained absences from school

Living in households where gambling caused problems

Students living in households where gambling was a cause of problems were more likely to have low academic performance than students living in households where gambling did not cause problems.

Number of homes lived in since birth

The 71% of Aboriginal students in WA who had lived in fewer than five homes since birth were more likely to be rated at low academic performance than students who had lived in five or more homes since birth. In the Kalgoorlie region, 68% of students had lived in fewer than five homes and six in ten (59%) of these students were rated at low academic performance.

Schools with lower student to teacher ratio

Students attending schools where there were less than 10 students per teacher were more likely to have low academic performance than students attending schools where the number of students per teacher was either 10-15 students or 20 or more. In WA, 1,980 of the 2,810 students (71%) who attended schools with less than 10 students to each teacher were rated at low academic performance. In the Kalgoorlie region, 50 of the 60 (76%) students in schools with less than 10 students per teacher were at low academic performance.

School suspension

Students suspended from school at least twice, were three and a half times as likely to be performing poorly at school than students who have never been suspended. In the Kalgoorlie region, 20 (2%) students had been suspended at least twice.

Repeating a grade

Students who had repeated a grade were more likely to have low academic performance than students who had not repeated a grade. In the Kalgoorlie region, 5% of students had repeated a grade compared with 3% in WA.

Comparison of effect of factors contributing to low academic performance among Aboriginal children in WA and the Kalgoorlie region

The table below lists the factors that influence low academic performance and their prevalence in both the Kalgoorlie region and Total WA and the degree of their effect. For example in the dark blue columns it can be seen that in the Kalgoorlie region, 56% of students were males and that 62% of these male students had low academic performance. For WA (light blue columns) 52% of students were males and 65% of these male students had low academic performance. The table also shows little difference between the Kalgoorlie region and WA as a whole.

	Factor		Low academic performance	
	Kalgoorlie	Total WA	Kalgoorlie	Total WA
	%	%	%	%
Students are males	56	52	62	65
School year (K to 7)	71	70	65	60
Absent from school for 26 days or more	58	50	66	68
Carers education less than Year 10	17	23	65	72
High risk of clinically significant emotional or behavioural difficulties	13	17	72	80
Aboriginal English spoken in classroom	19	15	81	80
Carer needed to see class teacher in last 6 months	18	23	77	62
Trouble saying certain sounds	15	12	70	69
Primary carer not in labour force	55	47	64	63
Primary carer attended funeral in last 12 months	72	70	63	62
More than 10 days unexplained absences	51	48	63	68
Gambling problems in household	—	4	—	73
Living in less than 5 homes	68	71	59	60
Suspended from school at least twice	2	3	—	87
Repeating a grade	5	3	—	83
Homework done in homework classes	14	16	72	73

School and Carer Engagement

DURING the consultation period of the survey most carers of Aboriginal children said that a good education was very important for their child. They were asked a range of questions about the school.

The carers of most (95%) Aboriginal students said that they felt welcome when approaching the school and were confident in being able to sort out problems that may arise with the school. The carers of four in five (80%) students were happy with how the school was performing. However, despite their high degree of satisfaction with the school environment, other findings from the survey indicated that primary carers were not fully aware of how their children were doing at school academically. For instance, primary carers of nine out of ten (90%) Aboriginal students reported the student to be doing OK with their school work. However, school teachers rated 58% of students as having low academic performance.

As shown in the graph below, almost half (49%) the Aboriginal students in WA were rated by their carer as doing OK at school, but rated by their teacher as having low academic performance. It was the same in the Kalgoorlie region where 49% of students were rated by their carer as doing OK at school while their teacher said their academic performance was low.

Aboriginal students rated by primary carers as doing OK in their school work although rated by their teacher as having low academic performance, by ICC region

Factors influencing differences in carer and teacher ratings of school work performance

Outlined below are the factors found to be associated with differences in ratings of school work performance between carers and teachers.

Primary carer speaks an Aboriginal language

Differences between reports of academic performance between primary carers and teachers were more likely where the student's primary carer spoke an Aboriginal language. In WA the primary carers of about 3,520 (18%) students could have a conversation in a Aboriginal language compared with the primary carers of 190 (19%) students in the Kalgoorlie region.

Primary carer's level of education

Ratings of student academic performance by primary carers who had education of 13 years or more were more likely to be consistent with ratings of academic performance by teachers. This level of schooling was completed by the carers of only 2% of students in the Kalgoorlie region and 6% of students in WA.

Primary carer's employment status

Students whose primary carers were employed were less likely to have their academic performance rated differently by carers and teachers than students whose carers were not in the labour force.

Students at risk of clinically significant emotional or behavioural difficulties

Differences in ratings of school work performance between carers and teachers were less likely if the student had been assessed as being at high risk of clinically significant emotional or behavioural difficulties by both their carer and teacher than by their teacher only.

Unexplained absences

As the number of unexplained absences from school increased, primary carers were more likely to differ from teachers in rating the child's school work performance. About 18% of students in the Kalgoorlie region had 1–10 days of unexplained absence and 51% had more than 10 days unexplained absence. This was similar for Aboriginal students in WA (19% and 48% respectively).

Primary carer had been forcibly separated from their natural family

Where the primary carer had been forcibly separated from their natural family there consistently appeared to be a greater difference between carer and teacher assessments of student school performance. In the Kalgoorlie region the primary carers of 17% of students had been forcibly separated, similar to WA as a whole (11%).

Importance of religion/spiritual beliefs

Students whose primary carers reported that their religion/spiritual beliefs were very much important in their lives were almost one and a half times more likely to have their academic performance rated differently by carers and teachers than students whose primary carers said that religion/spiritual beliefs were not at all important in their lives.

Carers of 37% of students in the Kalgoorlie region regarded their religion/spiritual beliefs as 'very much' important — similar to the proportion reported across the State (40%).

Overcrowding

Where students lived in an overcrowded home, carers and teachers were more likely to differ in their assessment of student performance. In the Kalgoorlie region, 17% of students were living in overcrowded conditions compared with 25% in WA.

Discussion

THE WAACHS is the most comprehensive study ever conducted describing the many factors that contribute to the educational disadvantage of Aboriginal students. The findings highlight the gap in educational outcomes between Aboriginal and non-Aboriginal students — differences in education measures in the order of 30 to 40 percentage points. These differences are larger than any observed in physical and mental health measures. Very little progress has been made over the past 30 years to effectively close the gaps in education resulting in limited access to lifelong learning, employment and economic benefits and the need for all education stakeholders to reconsider the types of strategies and programs to overcome this disparity.

This regional profile shows the educational outcomes of Aboriginal students in the Kalgoorlie region and compares them with WA. In terms of overall academic performance, students in the Kalgoorlie region reflected students in WA as a whole (60% of students in the Kalgoorlie region at low academic performance compared with 58% in WA).

The survey highlighted a wide range of child, carer, household and school environment factors that affect educational outcomes. The most significant of these were lower levels of academic achievement of carers of Aboriginal students; low levels of school attendance; and higher proportions of Aboriginal students at moderate and high risk of clinically significant emotional or behavioural difficulties. These factors show the greater need for schools and carers to work together to improve educational experiences of Aboriginal children. Actions taken to address disparities in these factors, in both Aboriginal students and their carers, can have important flow-on benefits for the education of students.

The survey findings also highlight strong links between mental health and educational outcomes, making it important for education systems, health systems and family services systems to work together to provide appropriate support and assistance to students with mental health needs.

The WAACHS findings suggest that there are two key principles that should underpin efforts to improve educational outcomes for Aboriginal students.

- ❖ The need for schools to engage carers and communities to break the cycle of intergenerational disadvantage between generations
- ❖ The need to improve early childhood and early school learning for Aboriginal children, to prevent children falling behind in the crucial early years of life.

These principles form the basis of the 15 recommended actions for moving forward to improve educational outcomes for Aboriginal children (see attached). They also encapsulate the themes of prevention and early intervention, aiming to ensure that there are far fewer Aboriginal children with excessively low levels of readiness to learn at school on arrival into Year 1.

“Aboriginal communities and governments must work in partnership and share responsibility for achieving outcomes and for building the capacity of people in communities to manage their own affairs.” (Ken Wyatt)
